

System Design:

App Description:

The App is like any kind of event planning app, I made it for my company so can't disclose its name also it yet to be deploy on online. The basic App idea is to allow user to book for the whole arrangement of wedding, parties, events, etc.

User can also use the app for booking a specific vendor of their need, also to book a venue of their choice by selecting from the app.

There is a feature in the app called as planning tool where user gives some raw data of guests list, event's venue, city and all to the app and according to the given data the app show the event budget to the user.

Mechanism:

The fornt-end is design using react-native.

The data is fetched through api's which is concatenated with the app's front-end.

User data is stored in shared hosting through MySql.
